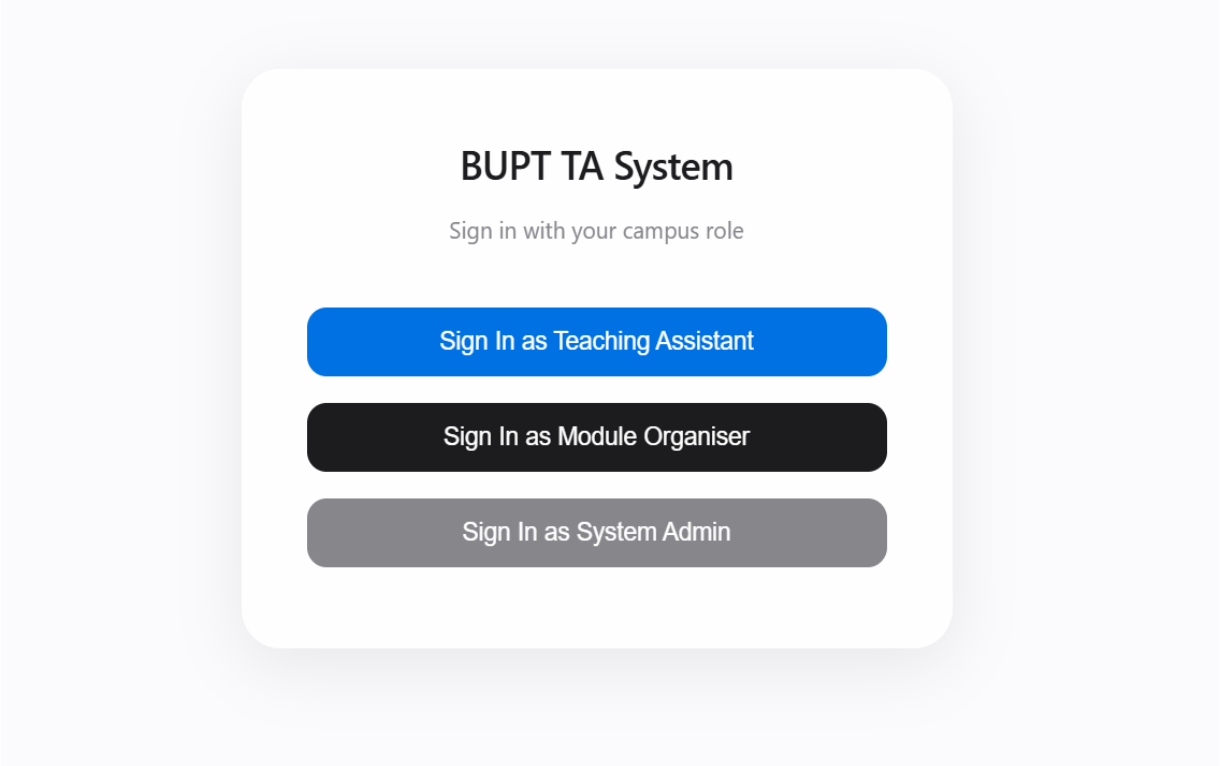
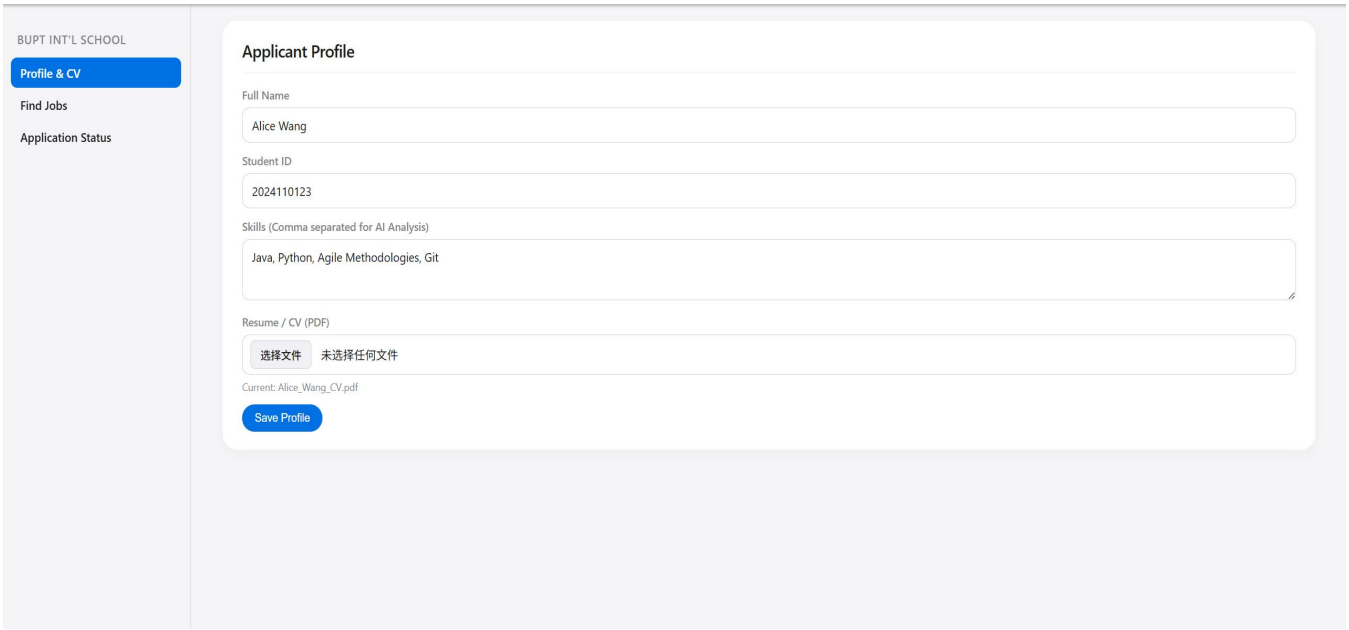
Prototype

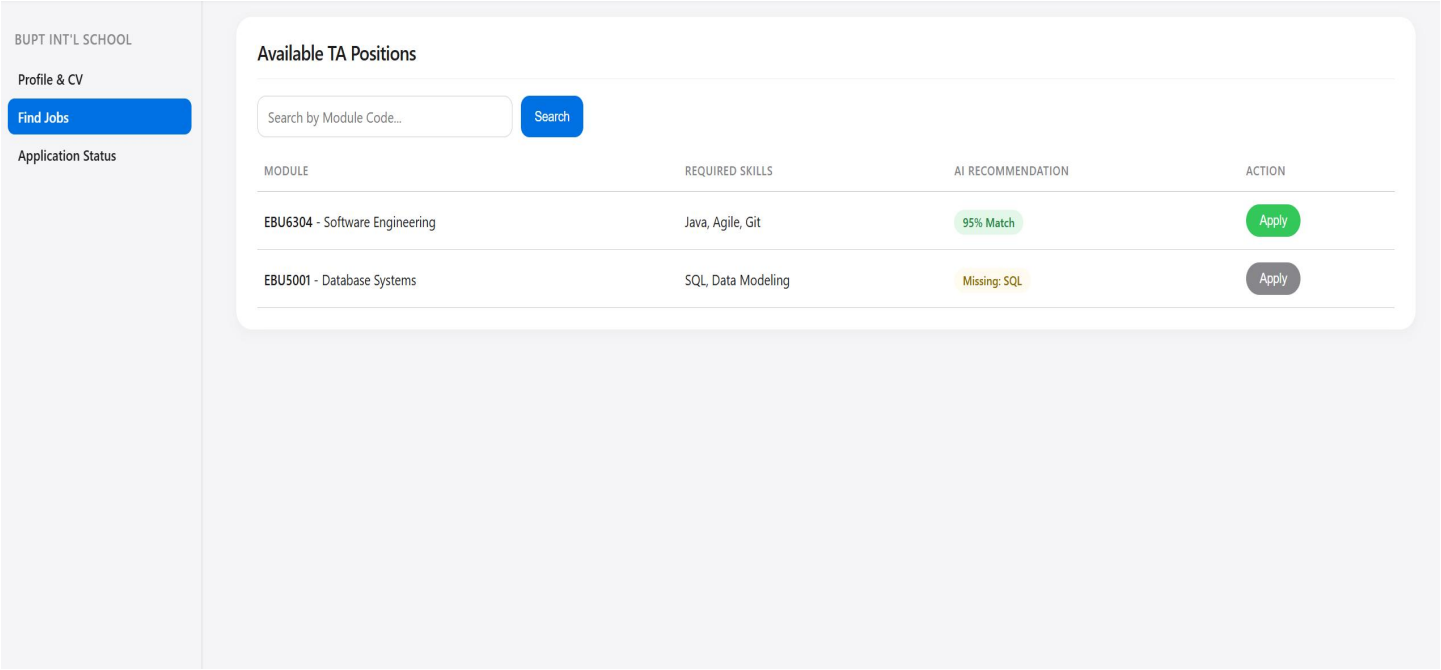
The following is the initial interface of the prototype, with three buttons available for clicking to enter. You can log in as a teaching assistant, as a module organizer, or as a system administrator.



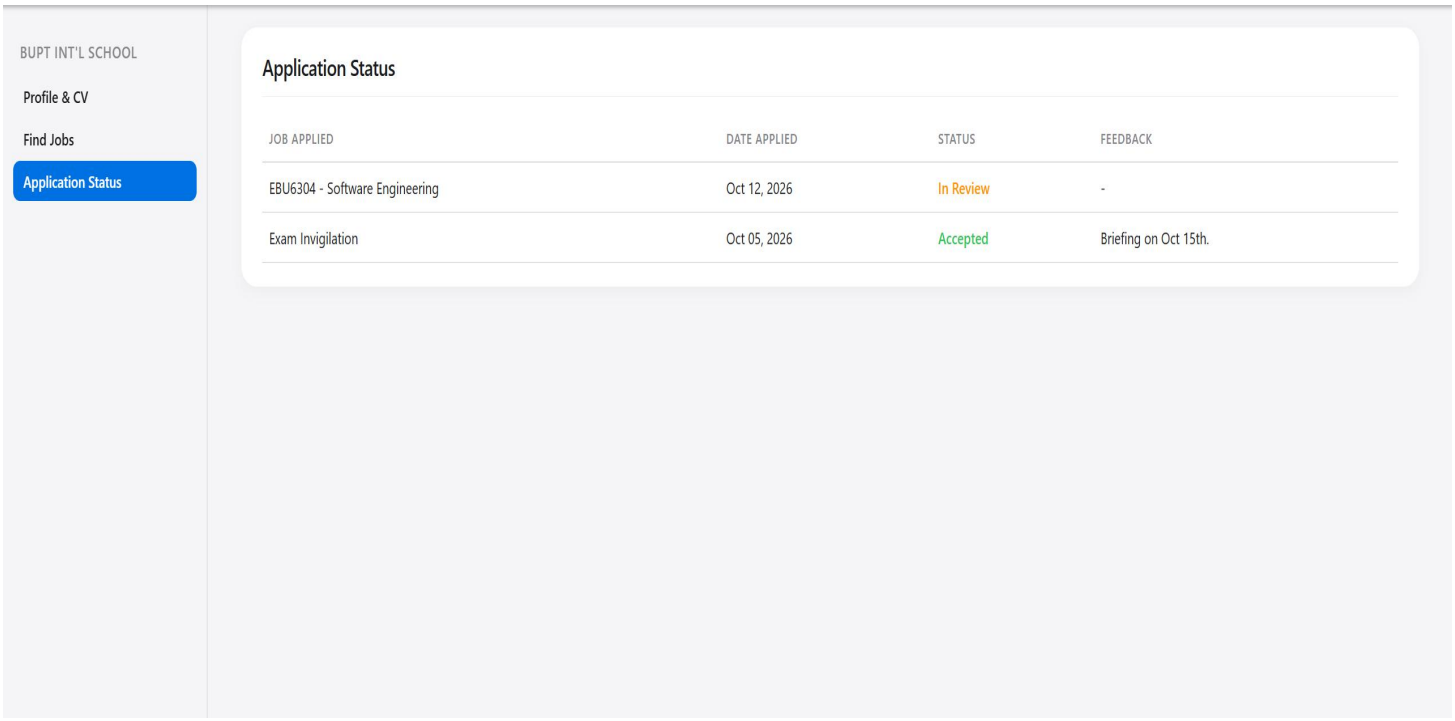
1-1 When the first button is clicked, it will navigate to the interface for filling in the applicant's profile, where the applicant can enter their name, student ID number, skills, and select and upload their resume.



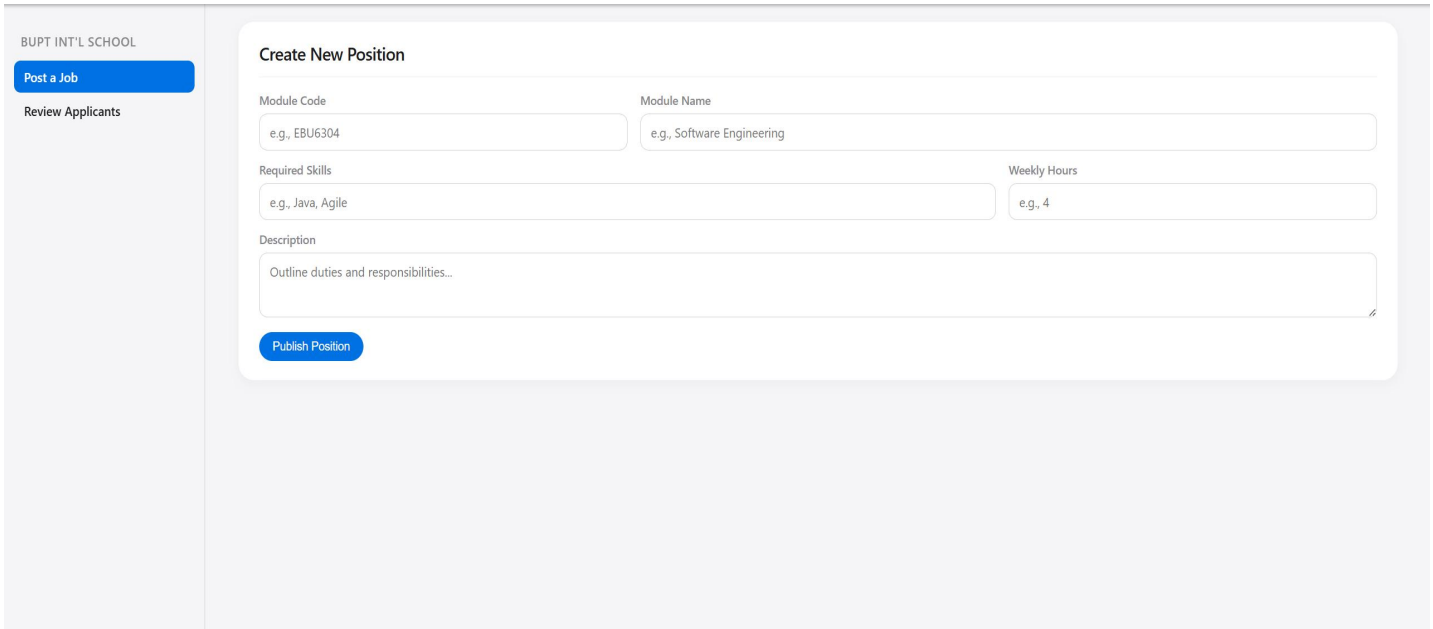
1-2 The second feature for logging in as a teaching assistant is to display teaching assistant positions available for job searching. Below are two examples of the corresponding modules, showing the
required skills for the courses to apply for, AI recommendations, and the apply button.



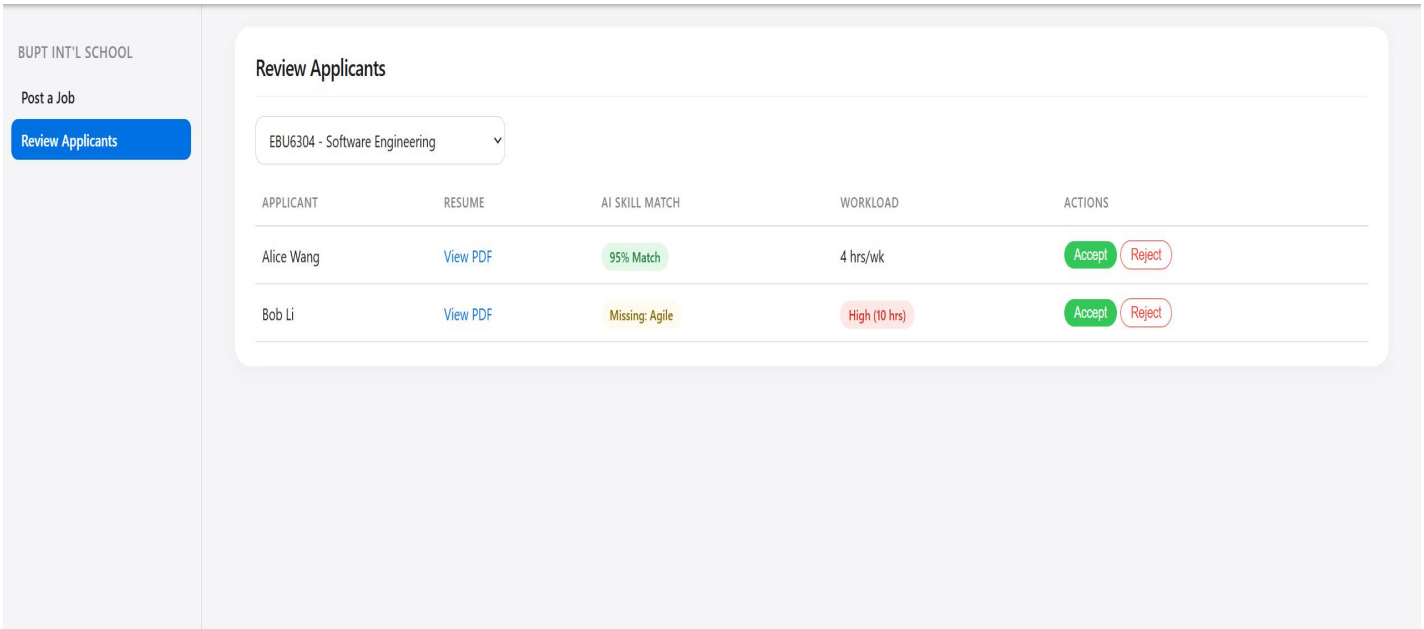
1-3 The third function when logging in as a teaching assistant is the application status page, which displays all positions that have been applied for, the applicable dates of the applications, the status of the applications, and the corresponding feedback for the applications. Below is a specific example.

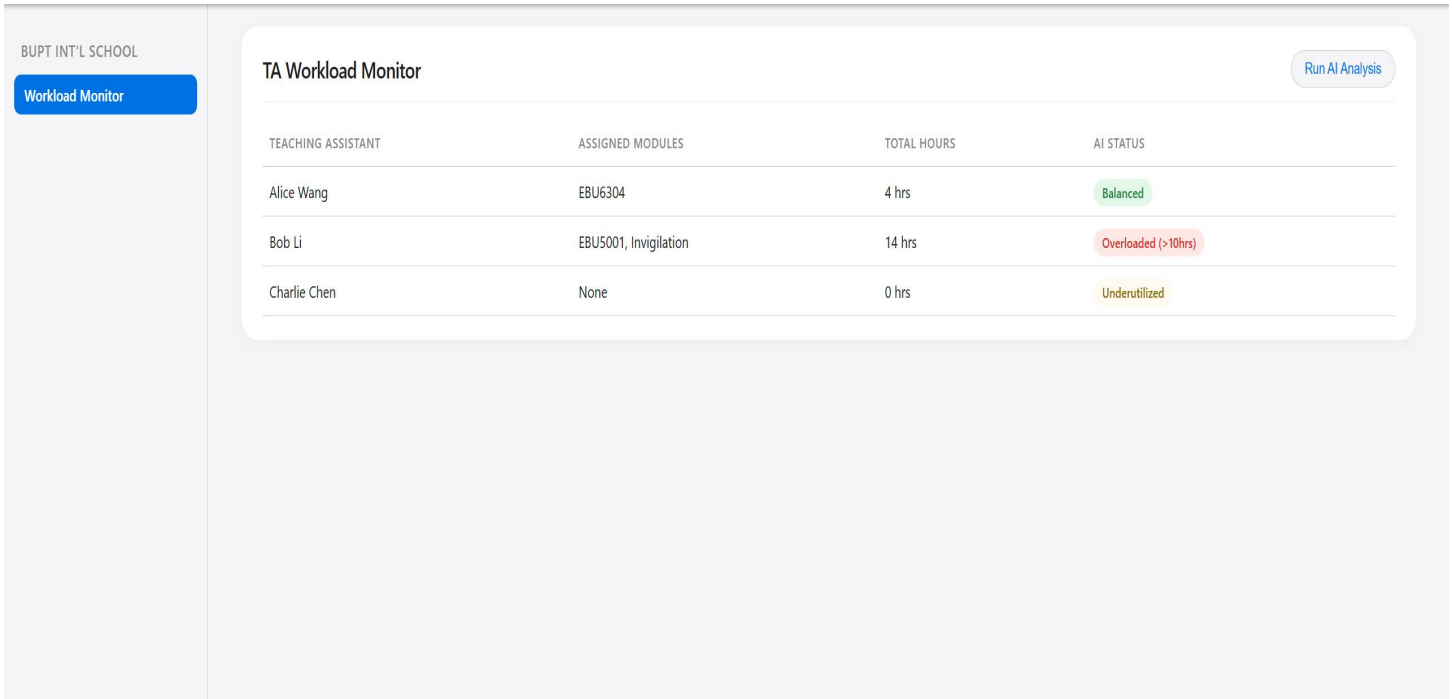


2-1 Logging in as a module organizer provides two functional interfaces. The first function is to create a new position, including the corresponding position number, module name, required skills, and a description of the module (such as an overview of specific duties and responsibilities).



2-2 The second function is to review applicants. The page includes the selection of the corresponding subject (taking the Software Engineering course as an example), the applicant's name, a button to view the submitted application resume, an AI skill matching column, workload display, and accept and reject buttons.





3. The page last logged in as a system administrator is the monitor page for the TA ’ s workload. This page shows the work situation of the teaching assistants performing tasks at their positions. It includes the teaching assistant's name, the designated section they are responsible for, the total working hours, and the display of the AI status.
